C

Leaduce NAM indecides Comparisting of the Partitis C virus (HCV); (4) inducing targeted RNA interference toward HCV in hepatic cells; (5) inhibiting replication of HCV; (6) a vector comparising a DNA segment encoding the RNA molecule; (7) a host cells comprising the vector of (6); (8) inhibiting replication of HCV in cells carrying HCV; (9) treating hepatitis C in a subject; (10) a modified siRNA molecule comprising a double-stranded RNA molecule of 10-30 nucleotides in length, which mediates RNA interference toward a target agent or virus and is linked to at least one receptor-binding ligand; and colecules have antiinflammatory, hepatorropic and virucide activities.

(11) inducing targeted RNA interference in a patient. The modified siRNA molecules are useful for inactivating virus in mammalian cells. The siRNAs are useful for treating hepatitis C virus, hepatitis D virus, hepatitis D virus, hepatitis E virus, Ebola virus, influenza virus, metapneumoniavirus, retrovirus, poliovirus, human papilloma virus, metapneumoniavirus or coronavirus infections. The methods of the invention can be used to correct or compensate for cellular physiological abnormalities involved in conferring susceptibility to viral infections in patients and/or alleviate symptoms of a viral infection in patients. The present sequence represents the SARS coronavirus nucleotide sequence, stranded RNA molecule of 10-30 nucleotides that inhibits replication of which is used in an example from the present invention.

Early detection of soft tissue sarcoma comprises determining expression of a gene in a first soft tissue sample and a normal soft tissue sample and comparing the gene expression, also useful in treating soft tissue

Example 2; SEQ ID NO 4937; 210pp; English.

The invention relates to a novel method for detecting soft tissue sarcoma which comprises obtaining a first soft tissue sample from an individual and a normal soft tissue sample from the same or different individual, determining the expression of a gene in both samples and comparing the

ö The present invention describes a method for monitoring differential expression of genes in a first filamentous fungal (FF) cell relative to expression of the same genes in one or more second filamentous fungal cells. The method uses fluorescence-labeled nucleic acids isolated from the FF cells and a substrate of expressed sequence tags (EST). The ESTs are used in the methods for monitoring differential expression of genes in a first filamentous fungal (FF) cell relative to expression of the same genes in one or more second filamentous fungal cells. Monitoring the global expression of genes from FF cells allows the production potential of the microcoganisms to be improved. New genes may be discovered, possible functions of unknown open reading frames can be identified and gene copy number variation and stability can be monitored. The expression of genes can be used to study how FF cells adapt to changes in culture expression of the gene in both soft tissue samples, where a higher level of protein expression in the first soft tissue sample indicates the presence of soft tissue sarcoma. The method of the invention has cytostatic applications and may be useful for detecting soft tissue sarcoma, possibly via gene therapy or vaccine production. The nucleic acid sequences may be useful in diagnostic and screening applications. The current sequence is that of a human soft tissue sarcoma-upregulated DNA of the invention. The current sequence is not shown within the specification per se but was submitted in CD format by the inventor. monitoring gene copy number variation and stability. Monitoring changes in expression of genes may be used to provide a representation of the way in which Badillus cells adapt to changes in culture conditions. extensive follow environmental stress or other physiological provocation. Extensive follow characterisation is unnecessary, when one spot on an array equals one gene or one open reading frame, since sequence information is available. This sequence represents a genomic sequence tag (GST) used in the method of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pot_sequences

```
conditions, environmental stress, spore morphogenesis, recombination, metabolic or catabolic pathway enginecting. Using ESTS provides several advantages over genomic or random cDNA clones including elimination of redundancy as one spot on an array equals one gene or open reading frame, and organisation of the microarray's based on function of the gene products to facilitate analysis of the results. AAF01478 to AAF11247 represents ESTS from Fusarium venenatum; AAF11248 to AAF11653 represents ESTS from Aspergillus niger; AAF11854 to AAF14878 represents ESTS from Aspergillus oryzas, and AAF14879 to AAF15337 represents ESTS from AAF16651 represents arease, which are all specifically claimed in the present

PROVART N. WPI; 2004-190374/18. BUDWORTH P. MOUGHAMER T. Plant cDNA #216. US2004016025-A1. 22-JAN-2004. Budworth P, antifungal Eukaryota. BUDW/) (MOUG/) (COOP/) (GLAZ/) (PROV/) (RICK/) (ZHOT/) (KATA/) (KREP/) (GOFF/) The invention describes a method of monitoring differential expression of genes in a first Bacillus cell relative to expression of the genes in other Bacillus cells, comprising hybridising labelled nucleic acid probes isolated from Bacillus cells to a substrate containing array of Bacillus genomic sequenced tags (GST), examining the array, and determining relative gene expression by an observed hybridisation reporter signal of a spot in the array. The method is useful for measuring the expression of genes in a first Bacillus cell relative to expression of the same genes in no en or more second Bacillus cells. The method is useful for monitoring global expression of several genes from a Bacillus cell, discovering new genes, identifying possible functions of unknown open reading frames and Monitoring differential expression of several genes in first Bacillus cell relative to expression of same genes in one or more second Bacillus cells, by using substrate containing Bacillus genomic sequenced tag Claim 4; SEQ ID NO 3992; 200pp; English.                                                                                                                                                                                                                                                                                                                                                                                셤
                                                   The invention steam, panicle, rough and present and constitutive transcription of an operatively linked nucleic seeds.

Or constitutive transcription of an operatively linked nucleic acid segment. The invention also relates to a method for augmenting a plant genome and a method of identifying a gene, where its expression is plant c genome and a method of identifying a gene, where its expression is constitutive altered in the seed, leaf, stem, panicle, pollen, root or is constitutive canola, cotton, peanut, tobacco or sugar beet, preferably maize, barley, cstom, peanut, tobacco or sugar beet, preferably maize, barley, cstom, peanut, tobacco or sugar beet, preferably maize, barley, cstomy peanut, tobacco or sugar beet, preferably maize, barley, cstomy peanut, the polymucleotides and the polypeptides they encode are useful for manipulating crop plants to alter or improve then the proteins, to incur resistance to insecticides, viruses or fungi, and to incur stress tolerance (e.g. salt, cold or drought) to ensure the plants have a high nutritional value with reduced apical dominance or dwarfism, early flowering or altered metabolic pathways. This sequence are presente a plant nucleic acid of the invention. Note: The sequence data for this clearing to the printed specification but was obtained in electronic format directly from USPTO at sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ·

o,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a method of determining whether the taxane compound TAXOL can be used to reduce tumour growth, comprising detecting expression of one or more sensitivity markers or 'resistance markers' in a sample of tumour cells. The method is useful for determining whether TAXOL treatment will be effective to reduce tumour growth in individuals, to enable appropriate therapy selection and to avoid ineffective treatment, especially on a patient by patient basis. It is also useful for determining whether TAXOL treatment should be continued in patients (if treatment is continuing to be effective) or discontinued (if a tumour has become resistant to the treatment). It may also be possible to determine effectiveness or continued effectiveness of other therapeutic agents/combinations of agents to which markers are sensitive/resistant, and to identify new anti-cancer agents affecting marker expression. The
polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, hematopolesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity in the diagnosis and/or reatment of cancer, leukaemia, nervous system disorders arthritis and inflammation. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

markers are useful for producing probes or primers that selectively hybridise to polymucleotides (e.g. probes hybridising to mRNA molecules), useful for detecting polymucleotides in samples. e.g. ovarian tissue (especially tumour) samples. The polypeptides encoded by the markers are useful for identifying compounds that selectively bind to the polypeptides, useful to detect polypeptides in samples. This sequence represents a tumour marker gene of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an isolated polynucleotide comprising any one of 38043 cDNA sequences, appearing as ACH12789-ACH50811, whose sequence was determined by the technique of SBH (sequencing by hybridisation). Also included is a purified polypeptide comprising a sequence corresponding to a reading frame of the novel polynucleotide. The nucleic acid sequences are useful in diagnostics as expressed sequence tags (EST) for identifying expressed genes or for physical mapping of the human genome, in forensics, in assessing biodiversities, or in identifying mutations responsible for genetic disorders and other traits. The nucleotide sequences are also useful as hybridisation probes, as oligomers for PCR, for chromosome and gene mapping, in the recombinant production of for chromosome and gene mapping, in the recombinant production of for chromosome and generating antisense DNA or RNA The purified polypeptide is useful for generating antisense specific for it. The present sequence is one of the 38043 isolated cDNA/EST sequences. Note: The sequence data
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ss; sequencing by hybridisation; SBH; expressed sequence tag; EST; mapping; biodiversity; genetic disorder.

```
The invention discloses a composition comprising two or more isolated rate or human polynucleotides or a polynucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent that is differentially repressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polynucleotide sequence which is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the compound that regulates the activity of one or more of the polynucleotides, a method for producing a pharmaceutical composition, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more of more of more or more of pain and a pharmaceutical composition comprising the one or more of polypeptides or more of more or more of pain and a pharmaceutical composition comprising the one or more of more or                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New composition comprising two or more isolated polypeptides, useful for
for this patent did not form part of the printed specification, but was obtained in electronic format directly from USPTO at segdata.uspto.gov/sequence.html?DocID=20030073623
                                                                                                                                                                                                       Gaps

The invention discloses a composition comprising two or more isolated rat or human polynucleotides or a polynucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector, comprising the nucleic acid sequence. Also comprising the vector, a method for identifying a nucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polynucleotide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polynucleotide sequence which is differentially expressed in the activity of one or more of the
                pain (e.g. spinal segmental nerve injury (Chung), chronic constriction injury (CCI) and spared nerve injury (SNI)) in an animal (e.g. gene therapy). The sequence presented is a rat DNA (shown in Table 2 of the specification) which is differentially expressed during pain. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           prostate cells and correlating with presence of prostate cancer, useful for detecting presence of prostate cancer, stage of prostate cancer.
                                                                                                                                                                                       which is differentially expressed during pain. Note: The sequence data
for this patent did not form part of the printed specification, but was
obtained in electronic form directly from WIPO at
             activity in an animal of one or more of the polypeptides given in the specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more polypeptides or their antibodies. The polymucleotide or the compound th modulates its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (Chung), chronic constriction injury (CLI) and spared nerve injury (SNI) in an animal (e.g. gene therapy). The sequence presented is a rat DNA (shown in Table 2 of the specification) which encodes one of the polypeptides of the invention
for identifying a compound or small molecule that regulates the

(e) selecting a composition for inhibiting prostate cancer in a patient; (f) assessing the prostate cell carcinogenic potential of a compound; (g) determining whether prostate cancer has metastasized in a patient; (h) assessing the aggressiveness or indolence of prostate cancer in a patient; (I) is also useful as a pharmacodyanamic or pharmacogenomic marker
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an isolated polypeptide (I) associated with breast cancer which is encoded by a nucleic acid molecule comprising a nucleotide sequence (S1). Further disclosed is an antibody that binds to the polypeptide of the invention. The activity of the polypeptide of the invention may be described as cytostatic. The antibody is useful for invention may be described as cytostatic. The antibody is useful for detection of (I) in a sample. Nucleic acid molecules of the invention are useful in the detection of breast tumours. (I) is useful as a marker for breast cancer and in breast cancer therapy. Sequences given in records ACN7881-ACN92934 represent nucleic acid markers associated with breast cancer. Note: The sequence listing does not form part of the specification but may be obtained in electronic format from the USPTO web
                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel isolated polypeptide associated with breast cancer, useful for detecting presence of polypeptide in sample, as a marker for breast

The invention relates to an isolated nucleic acid comprising any one of
the 6213 antisense sequences given in the specification where expression
of the nucleic acid inhibits proliferation of a cell. Also included are:
(1) a vector comprising a promoter operably linked to the nucleic acid
encoding a polypeptide whose expression is inhibited by the antisense
to its fragment whose expression is inhibited by the antisense
compound acid; (4) an antibody capable of specifically binding
polypeptide or its fragment whose expression is inhibited by the
antisense nucleic acid; (4) an antibody capable of specifically binding
colliferation or the activity of a gene in operor required for
proliferation or the activity of a gene or peroliferation or the polypeptide, (5) producing the polypeptide; (6) inhibiting cellular
proliferation, (7) identifying a nactivity against a biological pathway
required for proliferation, or that inhibits cellular proliferation; (8)
identifying a gene required for cellular proliferation or the biological
compound's activity; (11) a culture comprising strains in which the gene
compound's activity; (11) a culture comprising strains in which the extent
compound's activity; (11) a culture comprising strains in which the extent
cownich each of the strains is present in a culture or collection of
strains; or (13) identifying the target of a compound that inhibits the
compound an organism. The antisense nucleic acids required
condiferation of an organism. The antisense nucleic acids required
for cellular proliferation to a solate candidate molecic acids required
for cellular proliferation of an organism. The antisense nucleic acids required
for cellular proliferation of an organism. The antisense nucleic acids required
for cellular proliferation of an organism. The antisense nucleic acids required
for cellular proliferation of an organism. The antisense molecules for rational
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation or the activity of a gene in an operon required for proliferation, (7) identifying a compound that inhibits cellular proliferation; (8) identifying a gene rotivity against a biological pathway in which a proliferation or the biological pathway in which a proliferation or the biological pathway in which the test compound that inhibits proliferation of an companism acts; (9) manufacturing an antibiotic; (10) profiling a compound, a activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent

to which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polymucleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Recombinant DNA construct; transformed plant; improved plant property; cold tolerance; heat tolerance; drought tolerance; herbicide; osmosis; pathogen tolerance; pest tolerance; plant disease resistence; cell cycle pathway modification; plant growth regulator; homologous recombination; seed oil yield; protein yield; carbohydrate; nitrogen; phosphorus; photosynthesis; lignin; galactomannan; bacterial polymucleotide; gene; ss.

transformed plant having an improved property. The plant is a crop plant buth as maize or soybean. The method of producing a transformed plant having an improved property comprises transforming a plant with the recombinant DNA construct and growing the transformed plant, where the polynucleotide or polypeptide is useful for improving plant properties. The recombinant DNA construct is useful for improving plant properties. In improved plant properties, e.g. improved cold, heat or drought tolerance, to herbicides, extreme osmotic conditions, pathogens or peets, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of homologous recombination, modified seed oil or protein yield and/or content, improved plant growth and development under at least one stress condition, improved plant growth and development under at least one stress condition, improved lignin production or improved galactomannan condition, improved lignin production or improved dalactomannan condition condition, improved lignin production or improved dalactomannan condition con lign $\overset{\circ}{\sim} \overset{\circ}{\sim} \overset{\circ}$

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Description
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence Seq

Sequence 12384, Application US/09949016

Patent No. 6812339

Patent No. 681239

GENERAL INFORMATION:

TITLE OF INVENTION: POLYMORPHISMS IN KNOWN GENES ASSOCIATED

TITLE OF INVENTION: WITH HUMAN DISEASE, METHODS OF DETECTION AND USES THEREOF;

TURENT APPLICATION NUMBER: 60/949,016

CURRENT APPLICATION NUMBER: 60/241,755

PRIOR APPLICATION NUMBER: 60/237,768

PRIOR PILING DATE: 2000-10-03

PRIOR PILING DATE: 2000-10-03

PRIOR PILING DATE: 2000-10-03

PRIOR PILING DATE: 2000-00-03

PRIOR FILING DATE: 2000-00-03
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         NSGUENCE 12801/C

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 1, Application US/10827757

Sequence 1, Application US/10827757

Sublication No. US2005004071A1

GENERAL INFORMATION:
APPLICANT: Comper, Wayne
TITLE OF INVENTION: Charged Polysaccharides Resistant To Lysosomal Degradation During
TITLE OF INVENTION: Kidney Filtration And Renal Passage And Their Use To Treat Or
TITLE OF INVENTION: Whomer: US/10/827,757

CURRENT APPLICATION NUMBER: US/10/827,757

CURRENT FILING DATE: 2004-04-20

PRIOR APPLICATION NUMBER: 60/464,294

PRIOR FILING DATE: 2003-04-21

NUMBER OF SEQ ID NOS: 1
